Exploring Code Chunks

Arlo 9/10/2019

```
library(tibble)
library(gapminder)
library(DT)
```

Print out gapminder data:

gapminder

```
## # A tibble: 1,704 x 6
              continent year lifeExp
##
     country
                                             pop gdpPercap
##

                 <fct> <int>
                                   <dbl>
                                            <int>
                                                      <dbl>
## 1 Afghanistan Asia
                           1952
                                    28.8 8425333
                                                      779.
## 2 Afghanistan Asia
                          1957
                                    30.3 9240934
                                                      821.
                         1962
1967
1972
## 3 Afghanistan Asia
                                    32.0 10267083
                                                      853.
## 4 Afghanistan Asia
                                    34.0 11537966
                                                      836.
## 5 Afghanistan Asia
                                                      740.
                                    36.1 13079460
## 6 Afghanistan Asia
                            1977
                                    38.4 14880372
                                                      786.
## 7 Afghanistan Asia
                            1982
                                    39.9 12881816
                                                      978.
## 8 Afghanistan Asia
                            1987
                                    40.8 13867957
                                                      852.
## 9 Afghanistan Asia
                            1992
                                    41.7 16317921
                                                       649.
## 10 Afghanistan Asia
                            1997
                                    41.8 22227415
                                                       635.
## # ... with 1,694 more rows
```

Convert mtcars to a tibble, and wrap in data table:

```
datatable(as_tibble(mtcars))
```
